Adding a Transaction Flag

A Transaction Flag is a flag to a request. A CustomFlag with the specified flag name must already exist when used in the addon. If a corresponding flag is not found, it will not be added to the request. Flags that are defined internally by the system cannot be added. Available in the following addon types:

- System
- Addon
  - FormUser
  - FormMain
  - FormRequest

Parameters

- **TransactionNumber**: The transaction number to add the flag to (optional when this command is used in a FormRequest addon).
- **FlagName**: The name of the flag to be added to the request

Example

The following is an example of the syntax used in a SystemManager addon that will add a transaction flag to the ILLiad request with TransactionNumber 1234, and the flag that will be added to the request is "Expedite Request."

```javascript
ExecuteCommand("AddTransactionFlag", { 1234, "Expedite Request" });
```

FormRequest addon:

```javascript
ExecuteCommand("AddTransactionFlag", "Expedite Request");
```
